### **The Solar system:**

Solar System can be defined as the Sun and everything that orbits the Sun which also include the planets and their satellites. It can also be called a group of celestial bodies orbiting another star. In this paper, solar system refers to the system that includes Earth and the Sun. Solar energy is the energy from the sun. It comes to us in form of light and heat. Nigeria receives about  $4.851 \times 10^{12}$  PP KWh of energy from sun daily,  $1.804 \times 10^{15}$  PKWhP annually and the country has average solar Insulation of about  $5.535 \text{ KWh/m}^2 \text{ P/day}$  which will effectively be used for solar power installation, and will bring about total change in power system failure in the country

### **STEP BY STEP INSTALLATION OF SOLAR ENERGY:**

Solar power plant installation is very easy. But before the actual work begins, the most important issues that you must have done are to know the total electricity consumption for the household, this can be done by taking a physical view of all the appliances to check their power ratings to know the capacity of all the system components and the total number of panels, batteries and the capacity of charge controller and the appropriate inverter needed. Now the components are conveyed to the site a day before the actual installation. The stages in the installation include

**1. Arrange the photovoltaic PV modules:** After bringing out the PV with the ratings behind the panel, the information you will see is the maximum wattage, voltage, and amperes. After that, wire the panel according to the required need but I prefer the parallel connection (the voltages remain the same while the currents is added). Then mount the PV on the rooftop of

the building with a few inch gap and parallel to the surface of the roof. Solar PV can also be mounted on the ground. The solar array is usually best placed in perpendicular to the sun's rays, which change continuously over the course of the day and season. The most suitably location and inclination for a PV mounting is east front and slope of  $30-40^{\circ}$  P.P

2. **Charge controller:** The next thing to do after the setting up the solar PV array is to connect the charge controller (which you know is to ensure that the battery is not over-charged or over-discharged) directly from the output terminals of the solar PV using lighter gage wires. Note: DC loads can be directly connected to the charge controller. After the connection, we move to next step which is connecting the battery.
3. **Battery:** The batteries are properly connected either in series or parallel connection depending on your need, and then connect the battery to the charge controller at the port selected/indicated for it in solar charge controller. The next thing to connect is the inverter.
4. **Inverter:** The next setup is the inverter, as we discussed above the inverter converts the DC supply from the solar PV into the battery to AC supply in order to power our AC loads. Connect the battery terminal to the inverter with 2.5mm cable. Finally, from the inverter you connect to the external load in the house. The rating of the inverter should be the same with rating of the PV array.

Dear Sir,

**Sub: In-plant Training of B.E. Mechanical Engineering student permission - reg.**

M/s JCT College of Engineering and Technology, Pichanur, is a pioneering Engineering Institute in Coimbatore, affiliated to Anna University, Chennai managed by M/s Shri Jagannath Educational Health and Charitable Trust, Chennai.

We regularly arrange In-plant Training for our students so that the students will have an insight into the practical aspects of engineering. **B.E Mechanical Engineering** students of our institute are interested to do in-plant training in your esteemed organization. We will be highly obliged if you could kindly grant him permission for the same.
